/note="Organ: Stomach; Vector: pTZ18RP1; Site_1: EcoR1;
Site_2: Not1; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoR I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was adjusted to have about 60nt. The cDNA vector. An RNA strand converted to a DNA strand by Okapama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli Top10F' by electroporation method. The cDNA libraries constructed by this method are full-length enriched cDNA library."

a serine protease called D-G protein which is modulators that are useful for treating a liated by protease D-G, e.g. cancer, skin disorders, or neuropathic pain Nucleic acid encoding useful for identifying condition which is med

Claim 13; Fig 4B; 81pp; English

The invention relates to an isolated and purified nucleic acid that encodes a serine protease called D-G protein. The activity of the protein of the invention may be described as cytostatic, antiinflammatory, dermatological and anticoagulation. The serine protease of the invention is a member of the trypsin/chymotrypsin-like (S1) serine protease family, which play an important role in processes such as digestion and regulatory amplification cascades through the proteolytic activation of inactive zymogen precursors. Protease D-G modulating compounds are useful for treating a condition which is mediated by protease D-G, e.g. cancer, skin disorders, neuropathic path, inflammatory disorders, or coagulation diathesis/thrombosis. The polynucleotide encoding the protease is useful for identifying modulators of the functional protease. The D-G protein can be used for formulation of the functional protease. The D-G protein can be used for formulation of compositions for laundry detergents and skin care products. Protease Larget organisms. As the D-G protein is derived from a human, it is less likely to produce an allergic reaction in sensitive individuals when used in formulations for laundry detergents and skin care products. The current sequence represents the protease D-G cataytic domain in the zurrent sequence represents the protease D-G cataytic domain in the is a member of the try which play an importar regulatory amplificati for identifying, detecenceding the protease of the functional prot encodes a serine prote of the invention may } skin disorders, neuror diathesis/thrombosis. The invention relates target organisms. As likely to produce an in formulations for l D-G gene therapy may compositions for zymogen activation dermatological inactive of the of compo current

```

AAM99166 to AAH99904 encode the human proteins given in AAM25255 to AAM25963. The proteins can have activities based on the tissues and cells they are expressed in, such as: antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; cantiavescular; antianaemic; antialergic; antimutagen; cardiovascular; antianaemic; antialergic; antiatherary; antidiabetic; cytostatic; neuroprotective; antidepressant; nootropic; antiparkinsonian; and immunostimulant. The proteins and polynucleotides antiparkinsonian; and immunostimulant. The proteins and polynucleotides on production, The proteins and polynucleotides are useful for screening to production, The protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoietic disorders, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, catchinitis, asthma, diabetes, cancer, multiple sclerosis, depression, heurological disorders.

```

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing

                                                          fragment of a kinase, phosphatase, profess, processe inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational

The sequences given in AAG79356-59 show the colorectal cancer proteins, CGA7 and CJA8 proteins are colorectal cancer modulating proteins and have been mapped to chromosomes 2 (CGA7) and I (CJA8). These sequences may be used in the method of the invention for screening drug candidates. The method comprises adding a drug candidate to a cell that expresses an expression profile gene. The new conding CGA7, CJA8 or fragments and determining the effect of the drug candidate on the expression of the expression profile gene. The new methods are used to screen bioactive agents for the ability to bind to or modulate the activity of CGA7 or CJA8 and evaluate the effect of a candidate colorectal cancer drug. An antibody to CGA7 or CJA8 can inhibit the activity of CGA7 or CJA8, respectively, and is used to screen for an agent that can interfere with the binding of CGA7 or CJA8 to the antibody can be used to treat colorectal cancer. The antibody or a fragment of it is used to localize a therapeutic group to antibody or a fragment of it is used to localize a therapeutic group to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 110

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   292
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                230
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           352
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    a colorectal cancer tissue, where the therapeutic group is a cytotoxic agent or a radioisotope. Antisense molecules are used to inhibit colorectal cancer in a cell. Nucleic acid segments encoding CGA7 or CJA8 are used in a biochip. CGA7, CJA8 or a nucleic acid encoding it are used to elicit an immune response. CGA7 or CJA8 is used to determine the prognosis of an individual with colorectal cancer. Nucleic acid encoding CGA7 or CJA8 can be used in vaccines.
                                                                                                                                                                                                                                                                         Screening drug candidates for treating colorectal cancer, comprises determining the effect of the candidate on the expression profile gene of CGA7 or CJA8 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    KLGSFPSLAVAKIIIBENPMYPKDNDIALMKLQFPLTFSGTVRPICLPFFDBELTPATP

```

0

```
The invention relates to transmembrane serine proteases and their corresponding nucleotides and the protease domain of a type-II membrane-type serine protease (MTSP). MTSP is useful for identifying compounds that modulate or inhibits its proteolytic activity and for formulating a medicament for treating neoplastic disease. MTSP and its corresponding nucleotides are useful in preventing or treating tumours or cancers such as lung carcinoma, colon adenocarcinoma and ovarian carcinoma, in diagnostics and in hybridisation assays. MTSP is useful as a diagnostic marker for tumour development, growth and/or progression and as immunogens to generate antibodies that specifically bind to it. MTSP DNA is useful in a yeast two-hybrid system and in gene therapy. The present sequence is human transmembrane protease serine 4 (TMPRSS4) protein.
  neoplastic disease; tumour; cancer; cytostatic; adenocarcinoma; ovarian carcinoma; gene therapy; serine 4; TMPRSS4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel single chain polypeptide comprising protease domain of type-II membrane-type serine protease or its catalytically active portion useful for treating and preventing cancer and tumor
                                                                                                               .94

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               170
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a method of diagnosing colorectal cancer comprising determining the expression of a gene encoding CJA8 or its fragment in a first colon tissue of an individual, and comparing the expression of the gene to the expression of the gene in normal tissue from the individual or in tissue from a second unaffected individual. A difference in the expression indicates that the first individual has colorectal cancer. The CJA8 genes and proteins are useful for diagnosing and prognosticating colorectal cancer. The methods are also useful for screening candidate bioactive agents that can modulate colorectal cancer, or for treating or inhibiting colorectal cancer in a patient e.g. by gene therapy. This is the amino acid sequence of the human colorectal cancer modulating protein CJA8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            51 KIVGGYALDVDSWPWQVSIQYDKQHVCGGSILDPHWVLTAAHCFRKHTDVFNWKVRAGSD

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (BPT) isolated from human tissue for translational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 profiling.

Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         kinases, phosphatases, proteases, transporters, receptors or transcription factors), useful for colon cancer, gastric cancer, sarcoma, lymphoma

The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma or leukemia -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      369
and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           230
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         369
                                                                        The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing
                                                                                                                                                                                                                            myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (BPT) isolated from human tissue for translational
                                                                                                                                                                                                                                                                                                 profiling.
Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Wood

Sequences AAU29024-AAU2932B represent PRO polypeptides of the invention.
The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal acontrol sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The present sequence is a human PRO polypeptide (secreted and transmembrane). The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 110

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            KIVGGYALDVDSWPWQVSIQYDKQHVCGGSILDPHWVLTAAHCFRKHTDVFNWKVRAGSD

New isolated secreted and transmembrane PRO polypeptide userui for modulating biological activity of a cell, or for treating sports-related joint problems, osteoarthritis or rheumatoid arthritis

Claim 20; Fig 112; 399pp; English.

The invention relates to an isolated secreted and transmembrane PRO polypeptide having 80 % sequence identity to a sequence appearing as ABG95851-ABG95934 or their associated signal peptide, or a sequence of

c an extracellular domain of the proteins with their associated signal peptide or lacking its associated signal peptide. Also included are the nucleic acids encoding the proteins. Vectors, host cells the nucleic acids encoding the proteins. Vectors, host cells fusion proteins and antibodies which specifically bind to the proteins. The nucleic acids encoding the proteins. Vectors, host cells as a set useful for detecting a polypeptide designated as A, B, C or D in a sample suspected of containing an A, B, C or D polypeptide, D y contacting the sample with a polypeptide designated as B, F, G, H or I (or vice versa) and determining the formation of the formation of the presence of an A, B, C or D polypeptide in the sample, where A is a PRO1096 polypeptide, B is a PRO20010 polypeptide, B is a PRO20010 polypeptide, B is a PRO20010 polypeptide, B is a PRO20010 polypeptide, B is a PRO20010 polypeptide and I is a PRO30010 polypeptide and I is a PRO30010 polypeptide. The B, C, G, H or I polypeptide is labeled with B, C or D polypeptide. The B, C, B, C, H or I polypeptide is labeled with C adetectable label or is attached to a solid support. The proteins are useful for linking a bioactive molecule to a codi, ry He bioactive molecule is a toxin, a radiolabel or an antibody. The bioactive of against them are useful for modulating a biological activity of a cell expressing a polypeptide designated as A, B, C or D or B, F, G, H, or I. The cell is killed. The proceins are useful for identifying a polypeptide designated as A, B, C or D or B, F, G, H, or I. The cell is killed. The proceins are useful for identifying a causes death. of the proceins are useful as A, B, C or D or B, F, G, H, or I. The cell is killed. The proceins are useful of the proteins, as molecular weight markers for proteins are useful a with process, and as the treatment of a condition which is responsive to the proteins, as a therapeutic agents for treating sports-ralated joint problems.

The cell x wight markers for protein electrophores is purposes, and secreted or transmembrane protein of the invention

Sequence 9, Application US/09386653A

Patent No. 6458564

GENERAL INFORMATION:

APPLICANT: Andrade-Gordon, Patricia

APPLICANT: Darrow, Andrew

APPLICANT: Oi, Jian-shen

TITLE OF INVENTION: DNA encoding the novel human serine

TITLE OF INVENTION: protease T

TITLE OF INVENTION: protease T

FILE REFERENCE: ORT-1032

CURRENT APPLICATION NUMBER: US/09/386,653A

CURRENT FILING DATE: 1999-08-31

NUMBER OF SEQ ID NOS: 11

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 9

LENGTH: 315

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Darrow, Andrew L.

APPLICANT: Qi, Jenson

APPLICANT: Qi, Jenson

TITLE OF INVENTION: Idenification and Characterization of the complementary

TITLE OF INVENTION: DNA encoding the novel human serine protease C-E

FILE REFERENCE: ORT-1030

CURRENT APPLICATION NUMBER: US/09/386,629

CURRENT FILING DATE: 1999-08-31

NUMBER OF SEQ ID NOS: 11

SOFTWARE: PatentIn Ver. 2.0

SEQ ID NO 8

LENGTH: 327

TYPE: PRT

ORGANISM: Artificial Sequence

Patent No. 6420157
GENERAL INFORMATION:
APPLICANT: Darrow, Andrew
APPLICANT: Darrow, Andrew
APPLICANT: Qi, Jenson
APPLICANT: Andrade-Gordon, Patricia
TITLE OF INVENTION: Zymogen Activation System
FILE REFERENCE: ORT-1028
CURRENT APPLICATION NUMBER: US/09/386,642
CURRENT FILING DATE: 1999-08-31
NUMBER OF SEQ ID NOS: 60
SOFTWARE: PatentIn Ver. 2.0

Sequence 25, Application US/08508448C

Patent No. 5804410

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Kazuyoshi YAMAOKA et al.

TITLE OF INVENTION: NUCLEIC ACID SEQUENCE ENCODING

TITLE OF INVENTION: TRYPSIN-LIKE ENZYME AND PROCESS FOR PRODUCING THE BNZYME

NUMBER OF SEQUENCES: 25

CORRESPONDENCE ADDRESS:

ADDRESSEE: Wenderoth, Lind & Ponack

STREET: 805 Fifteenth Street, N.W., #700
                                                                                                                                                                                                                                                                                                                                  61 PHSQPWQAALVMENELFCSGVLVHPQWVLSAAHCFQN----SYTIGLGLHSLEADQEPG 115

Sequence 82, Application US/09370838
Patent No. 6444425
GENERAL INFORMATION:
APPLICANT: Reed, Steven G.
APPLICANT: Lodes, Michael J.
APPLICANT: Mohamath, Roadoh
APPLICANT: Secrist, Heather
TITLE OF INVENTION: COMPOUNDS FOR THERAPY AND DIAGNOSIS OF
TITLE OF INVENTION: LUNG CANCER AND METHODS FOR THEIR USE
FILE REFERENCE: 210121.475C1
CURRENT FILING DATE: 1999-08-09
EARLIER PILING DATE: 1999-08-09
EARLIER PILING DATE: 1999-04-02
NUMBER OF SEQ ID NOS: 289
SOFTWARE: FastSEQ for Windows Version 3.0
SEQ ID NO 82
LENGTH: 418
TYPE: PRT
ORGANISM: Homo sapien
S-09-370-838-82
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      THERAPY AND DIAGNOSIS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         32.9%; Score 526.5; DB 4;

US-09-851-588-6

i Sequence 6, Application US/09851588

j Patent No. US20020042067A1

j GENERAL INFORMATION:

APPLICANT: Mack, David

APPLICANT: Wilson, Keith E.

ITILE OF INVENTION: NOVEL METHODS OF DIAGNOSING COLORECTAL CANCER, COMI

TITLE OF INVENTION: OF SCREENING FOR COLORECTAL CANCER MODULATORS

FILE REFERENCE: A-68829-1/DJE/JJD/AMS

CURRENT FILING DATE: 2001-09-24

PRIOR APPLICATION NUMBER: US 09/642,252

PRIOR APPLICATION NUMBER: US 09/656,002

PRIOR APPLICATION NUMBER: US 09/656,002

PRIOR FILING DATE: 2000-09-06

NUMBER OF SEQ ID NOS: 9

SOFTWARE: Patentin version 3.1

SEQ ID NO 66
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
